

# Comparison of monthly patterns of abundance and vertical distribution of *Pseudocalanus* spp. in five regions of Georges Bank during 1999 Broadscale surveys. Ann Bucklin (University of New Hampshire), Peter H. Wiebe and Dennis J. McGillicuddy (Woods Hole Oceanographic Inst.)

## Abstract

The cryptic copepods, *Pseudocalanus moultoni* and *P. newmani*, exhibit different month-to-month patterns of abundance and vertical distributions in the different regions of Georges Bank. Using a standard grid, concentrations of females for each species were mapped for 3 depth strata: surface (0-15 m), sub-surface (15-40m), and deep (below 40m). Broadscale standard stations were assorted into five regions of Georges Bank: 1) northern flank, 2) Bank crest, 3) Northeast peak, 4) southern flank, and 5) Slope Water. During stratified conditions (April to June) on the Bank crest and southern flank, a significantly greater proportion of *P. newmani* are found in the top stratum, where they are subject to wind-driven transport. The greater preference of *P. moultoni* for deeper waters during these months may increase the likelihood of retention of these populations on Georges Bank.

***Pseudocalanus* spp. in the western Gulf of Maine:** In stratified waters, *P. moultoni* is concentrated at depth; *P. newmani* is more abundant at surface. In a fully-mixed water column, the two species show similar patterns of vertical distribution. Figures and data from Manning (2003), Manning & Bucklin (2004).

**In conclusion:** Although the 2 species are morphologically cryptic, they show distinct patterns of vertical distribution and abundance on both Georges Bank and the Gulf of Maine. Whether these differences result from distribution patterns, ecological preferences, and/or individual behaviors will require additional study.

**Acknowledgments:** Christopher A. Manning (UNH) provided the western Gulf of Maine data and analysis; Meredith A. Bailey and Kaitlin Bonner (UNH) assisted with laboratory analysis. Valery Kosyrev (WHOI) assisted with objective analysis. E.G. Durbin and M. Casas (URI) provided unpublished data from the U.S. GLOBEC Zooplankton database.
