Hydrographic Data from the GLOBEC Long-Term Observation Program off Oregon, 2004

Introduction

As part of the GLOBEC Northeast Pacific Program, a Long Term Observation Program (LTOP) of repeated hydrographic observations along lines off Oregon began in September 1997 (Fleischbein et al, 1999; Fleischbein et al, 2001; Fleischbein et al, 2002; Fleischbein et al, 2003). Of these lines, NH, off Newport, had been sampled frequently during the decade from 1961 to 1970, and another, FM, off Coos Bay, had been sampled repeatedly in 1981-1983. During 2004, the LTOP program continued sampling along these two lines and three additional lines off Oregon and California. The program includes measurements of upper ocean currents by the ship-borne Acoustic Doppler profiling system, and nutrient, chlorophyll and zooplankton sampling at selected stations; those results will be presented elsewhere. This report presents the CTD data from two cruises made during August and September 2004.

During the 2004 cruises, sampling occurred on five separate lines (Table 1, Figure 1): the Newport Hydro (NH) line which extends 150 km west along 44°39.1'N off Newport, Oregon; the Strawberry Hill line which extends 72 km along 44° 15'N; the Heceta Head (HH) line which extends 100 km west along 44°00'N off Heceta Head, Oregon; the Five Mile Point (FM) line which extends 65 km west along 43°13'N from Coos Bay, Oregon; and the Rogue River (RR) line which extends 65 km west long 42°30'N from the Rogue River, Oregon. Station names on each line reflect historical usage: for the NH line, the numerical suffix indicates the distance from shore in nautical miles; for all other lines, the station location names are numbered sequentially. Each section except the Strawberry Hill line includes at least two stations beyond the 1000 m isobath, and the maximum CTD sampling depth is 1000 m.

The cruises were on the R/V Wecoma, operated by Oregon State University from her homeport of Newport, Oregon. The cruise name convention is as follows: the first letter designates the ship (W for Wecoma), the next four digits indicate the beginning year and month, and the final letter distinguishes between cruises starting in the same month (A for first, B for second, etc). Participants on the 2004 cruises (Table 2) also participated on previous LTOP cruises to ensure similar sampling protocols were used throughout the project. Cruise W0409A was primarily a mooring cruise (Dr. P. Michael Kosro, Principle Investigator); only the CTD data are presented here.

Cruise W0408D started CTD sampling on 30 August at NH-1 (Table 3, Figure 2). In order to maximize darkness for the Bongo net tows, the CTD stations were done in their usual order out to NH-25, then the ship returned to NH-20, NH-15 and NH-10. CTD stations and net tows were then done in order from NH-35 out to NH-85, finishing sampling on the line on 31 August. The ship transited to HH-5 on the Heceta Head line, arriving on 1 September, to begin working inshore to do Bongo net tows in darkness. CTD sampling resumed at HH-1a and the line was completed on 1 September, working out to HH-7.

Due to reports of a possible near-bottom hypoxic event occurring south of Newport, the Strawberry Hill line was added to the sampling regime. Strawberry Hill stations had been sampled repeatedly by the PICSO project. CTD sampling on the Strawberry Hill line began at SH-9 on 2 September, followed by SH-8. Only Bongo net tows were done on the way in towards shore from SH-7 to SH-1 to allow sampling in darkness. CTD sampling resumed at SH-1 on 2 September, and the line was worked out to SH-7. Two stations were done over Stonewall Bank, followed by a repeat of the CTD stations from NH-5 to NH-25. The same NH stations were then

worked toward shore with net tows only, finishing NH-5 on 3 September.

W0409a sampled the NH line out to NH-25 (Table 4, Figure 3), the FM line and the RR-line from 7 to 9 September, 2004. Additional casts were done at the two mooring sites.

CTD Data Acquisition and Calibration

All CTD/rosette casts were made with a Sea-Bird 9/11-plus CTD system equipped with dual ducted temperature and conductivity sensors (Table 5). A transmissometer and fluorometer were mounted adjacent to the CTD and a Sea-Bird Beckman-type dissolved oxygen sensor was mounted on the rosette adjacent to the CTD sensors (Table 5).

The fluorometer had the time constant set to 1 second, and the range set to medium ($X_3 = 10 \text{ mg m}^{-3}$ chlorophyll). The transmissometer was configured with a wavelength of 660 nm and pathlength of 25 cm. The fluorometer and transmissometer data were recorded as voltages by the CTD system. All fluorometer results are presented as fluorescence voltage.

Air calibrations of the transmissometer were recorded during W0408D for correcting transmission voltage and were used in computing the light transmission values for W0408D and W0409A. The methodology utilized to compute light transmission followed the method given by SeaBird (2001) to calculate a slope and offset correction. The equation used to compute percent light transmission is:

$$\%LT = (19.402 * Vx) - 1.0423$$

where %LT = calibrated % light transmission and Vx = raw output voltage.

Calibrated transmission voltage is plotted for both cruises in Appendix A and presented as percent light transmission in the data listings.

The pressure sensors were Digiquartz pressure transducers and calibrated by Sea-Bird (Table 5). The Sea-Bird CTD temperature and conductivity sensors were also calibrated by Sea-Bird at least once a year (Table 5). The deck unit provided a correction for the time lag between T0 and C0, and no correction for the lag between T1 and C1. Plots of T0-T1 differences were used to check the stability of the temperature calibrations. At each CTD station, samples were collected at one or more depths for *in situ* calibration of the conductivity sensors. Twelve 5-liter Niskin bottles were attached to the rosette and at most stations all of the bottles were fired. Nearly all of bottles were used for biological analyses, with one bottle reserved specifically for the CTD calibration. Usually one or two of the biologist's sample depths also coincided with a mixed region for an additional salinity sample, and duplicate salt samples were drawn from 1 to 3 Niskin bottles at each station. The pressure, temperature and conductivity data for each bottle firing depth were extracted from the recorded up cast data using the Sea-Bird Seasoft DATCNV and ROSSUM utilities.

Table 5. Instruments and sensors used for CTD sampling, and dates of laboratory calibration. Cruise station numbers are listed for each CTD used, and a dot represents a sensor used for all stations of a cruise. CTD primary (P) and secondary (S) temperature and conductivity sensors are shown, with the sensor pair used in final processing marked (*) or as footnoted.

Salinity samples were run on a Guildline Autosal in a lab on shore. IAPSO Standard Water was used to standardize and check the salinometer at the beginning and end of each batch of 24 samples. The Guildline Portasal determines water sample salinity with a precision of ± 0.002 and an accuracy of ± 0.003 . Sample conductivity was calculated using the sample salinity value with the CTD temperature and pressure values; a value of 4.2914 S m^{-1} for the conductivity of standard seawater at 15°C (Culkin and Smith, 1980) was used to convert the measured sample conductivity ratios to conductivity. Occasionally the CTD-sample differences were larger than three standard deviations from the mean; these occurred in regions of sharp vertical gradients and were eliminated from the final calibration data sets.

The results of the CTD - bottle comparisons are shown in Table 6. Analysis showed no corrections were needed in conductivity for the two cruises.

The preferred sensor pair used in final CTD data processing for each cruise is shown in Table 5. The preferred pair was chosen by examining temperature and conductivity data for each cast for the least number of spikes (caused by biological detritus or electrical interference), and the calibration data. Station 26 of W0408D had clogging in the secondary sensor pair, and station 13 of W0409A had clogging in the primary sensor pair.

Table 6. Results of *in situ* conductivity calibration for both sensor pairs. Columns show the range of station numbers, number of samples (N), correction applied to CTD conductivity, and the average and standard deviations of the bottle - ctd salinity differences.

Cruise	Stations	N(S0/S1)	Correction		Average		Standard Deviation	
			C0	C1	S0	S1	S0	S1
W0408D	1-39	55/56	no corr.	no corr.	0.001	0.000	0.003	0.003
W0409A	1-24	40/43	no corr.	no corr.	0.003	0.003	0.005	0.005

CTD Data Processing

The CTD data were processed using the Sea-Bird SEASOFT software, and included all of the normal steps, i.e., using SEASOFT modules DATCNV, ALIGNCTD, WILDEDIT, CELLM, FILTER, LOOPEDIT, DERIVE and BINAVG to obtain 1-dbar average values of pressure, primary and secondary temperature, primary and secondary conductivity, dissolved oxygen concentration and the two voltages from the fluorometer and transmissometer. The ALIGNCTD module was run with the T-C offset for the primary sensor pair as 0.000 sec, and the T-C offset for the secondary sensor pair as 0.073 sec; oxygen was advanced 3.0 sec relative to pressure. The dissolved oxygen concentration was calculated by the DERIVE module using the manufacturer's calibration. CTD oxygen and results of oxygen titration of samples collected at a few stations are compared n Appendix B.

CTD Data Presentation

Derived parameters, including salinity, potential temperature (theta), density anomaly (sigma-theta) and specific volume anomaly were computed from the processed and calibrated 1-dbar values of temperature and conductivity using standard algorithms (Fofonoff and Millard, 1983).

For each station, we present a plot of the vertical temperature, salinity, and sigma-t profiles, and a listing of the observed and derived variables at standard pressures. Header data includes the CTD Station Number and Name, Latitude (degrees and minutes North), Longitude (degrees and minutes West), Date and Time (UTC), and Bottom Depth (in meters).

Following the station plots and standard depth listings, vertical sections of temperature, salinity, sigma-theta and dissolved oxygen are shown for each hydrographic line.

Acknowledgements:

We are deeply grateful to COAS colleagues Linda Fayler, Daryl Swensen who participated in the CTD/rosette sampling. The CTD and rosette on Wecoma are maintained by the OSU Marine Technicians, under the supervision of Marc Willis. These cruises would not be possible without the steady work and dedication of Wecoma's crew.

These observations were supported NSF Grant OCE-0000733. This report is a contribution of the U.S. GLOBEC program, jointly funded by the National Science Foundation and the National Oceanic and Atmospheric Administration.

Appendix B: Oxygen calibration data.

APPENDIX B. CALIBRATION OF DISSOLVED OXYGEN DATA

Dissolved oxygen concentrations reported in this data report were those measured by a Sea-Bird SBE 43 oxygen sensor, mounted on the SBE 9/11*plus* CTD. The sensors were calibrated using recent SBE calibration data (see Table 5 for calibration dates) and the results of comparisons to standard Winkler titrations of water samples collected at a few stations on each of the cruises. The sample titration values (collected during ascent) were compared with CTD values at the same depths (measured during ascent).

There are some systematic differences between Winkler and CTD values, which tend to increase with time since calibration, as might be expected from aging of the sensor. New oxygen calibration constants were derived from the Winkler and oxygen probe data using the method recommended by Sea-Bird (Application Note No. 64-2) for the SBE 43 sensors. These results are presented in linear regression plots and scatter diagrams (one for each 2004 cruise), and the new *Soc* and *Voffset* values are presented in Table B1. Profile plots of corrected dissolved oxygen (during descent) and sample oxygen (collected during ascent) are also presented for each station.

The full set of sample values of the dissolved oxygen concentration measured by Winkler titration is given in Table B2.

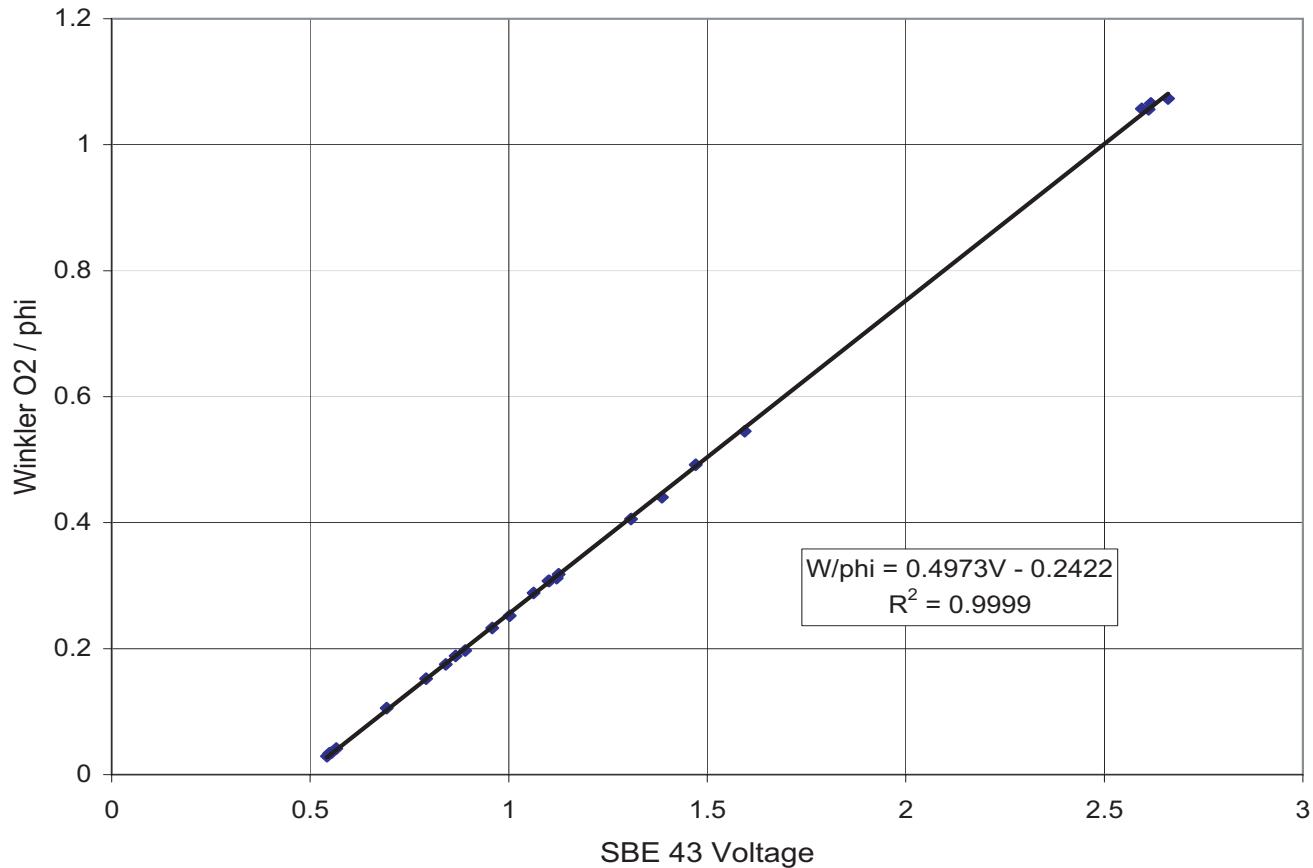

Table B1. Results of comparisons of Winkler titration and CTD values of dissolved oxygen concentration for 2004 cruises using Sea-Bird methodology.

	Number of Samples	Slope	Offset	SOC	Voffset
W0408D	24	0.4973	-0.2422	0.4973	-0.4870
W0409A	14	0.5060	-0.2482	0.5060	-0.4905

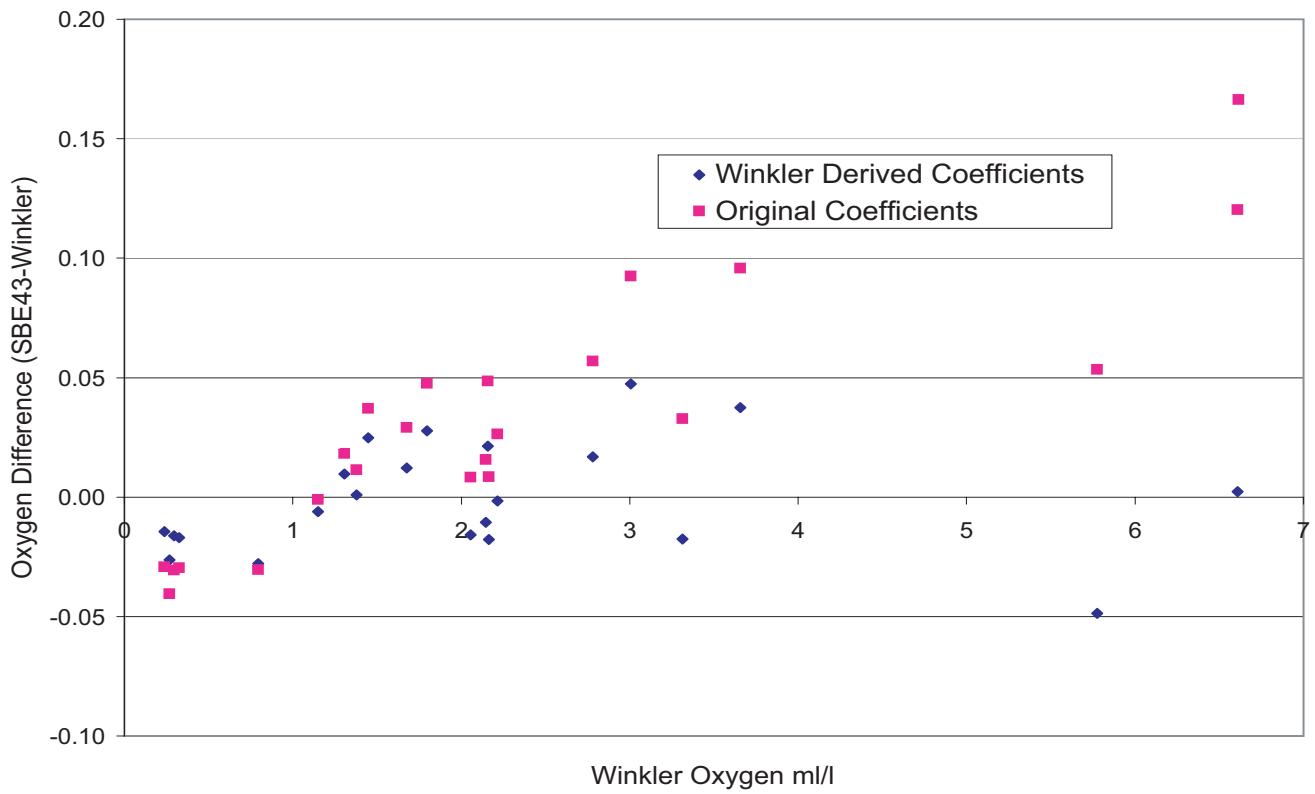

Table B2. Oxygen calibration data for W0408D and W0409A.
