

PRELIMINARY CRUISE REPORT, W9909C  
R/V WECOMA, 22-27 September 1999  
GLOBEC/ENSO Long-Term Observations off Oregon

Submitted by Jane Fleischbein  
College of Oceanic & Atmospheric Sciences  
Oregon State University  
Corvallis, Oregon 97331-5503  
fleis@oce.orst.edu, 541.737.5698

FILING DATE: 10 October 1999

CONTRACT/GRANT NUMBER: NOAA Award NA86OP0589 and OCE-9732386.

PRINCIPAL INVESTIGATOR(S): GLOBEC: Adriana Huyer, Robert L. Smith,  
P. Michael Kosro, P. A. Wheeler, W. T. Peterson and Jack A. Barth

PURPOSE: To determine physical, plankton and nutrient/chemical conditions over the continental margin for climate change studies in NE Pacific. In particular, to make CTD and CTD/rosette and net tow stations along 4 lines (off Newport, Coos Bay, Crescent City and Eureka), to make additional stations along a fifth line (off Rogue River or Heceta Head if time permits), to deploy drifters at selected locations on the Newport line, and to make continuous observations of currents using ADCP and of surface-layer temperature, salinity and fluorescence by means of ship's thru-flo system. Table 1 shows the intended CTD station positions.

SAMPLING PLAN:

1. Use ship's intake continuously for Temperature, Salinity, Fluorescence
2. Continuous ADCP Profiling (150 kHz transducer) for water velocity and backscattering for bio-acoustics.
3. Standard CTD Stations using SBE 9/11 plus CTD system for Temperature, Salinity, Fluorescence, Light Transmission, Oxygen.
4. Rosette sampling: 5 liter bottles for nutrients, and chlorophyll.
5. Deploy surface drifters after selected NH-line stations.
6. Vertical net tows: WP-2 nets 200 m to surface; Oblique tows: Bongo nets (70 cm dia) 200 m to surface at 2-3 kts.

CRUISE NARRATIVE

Only a brief overview of the cruise is presented here. A detailed event log is provided in Table 2, and the participating personnel are listed in Table 3. Wecoma departed Newport at 1000 PDT, 22 September 1999, and we began sampling offshore along the Newport Line. At about 1630 PDT, while at NH-15, Amy Chiuchiolo suffered an injury to her finger, and Wecoma proceeded back to Newport to disembark her for medical treatment. Wecoma sailed again from Newport at 1920 p.m., and returned to NH-15 to continue sampling. After completing Newport Line at 1235 PDT, 23 September, we transited to the offshore end of the FM-line, and began sampling there about 2030 PDT. Winds remained moderate for the FM line, and it was completed about 0930 PDT, 24 September. From the inshore end of the FM line, we transited along the shelf to the inshore end of the CR-

line, and began sampling there at 1630 PDT, 24 September. Winds increased abruptly, but decreased rapidly after our station at CR-2, and we were able to continue sampling through the night, completing CR-9 at about 0700 PDT, 25 September. Northerly winds increased gradually during our transit to EUR-1, with the sea state building. We were able to complete sampling at EUR-1 and EUR-2, but winds increased again, and we had to break off sampling after the CTD cast at EUR-3, at about 1800 PDT, 25 September. We attempted to continue steaming west for ADCP sampling along the line, but seas were too rough, and by 1900 PDT we were hove-to, making slow progress into the wind through the night. After lunch the next day, we reached the inshore end, RR-1 (42.5°N, 124.5°W), of a potential sampling line off the Rogue River; we ran westward to RR-7 (42.5°N, 125.2°W) for ADCP sampling of the currents along this transect. After reaching this point at 1530 PDT, we headed north and reached NH-20 at 0345 PDT, 27 September. From there we made a small-scale ADCP survey for comparison with surface currents measured by a local CODAR installation. We arrived alongside the pier at Newport at about 1330 PDT.

## PRELIMINARY RESULTS

Vertical sections of selected parameters measured by the SBE CTD system (temperature, salinity, density, and fluorescence voltage) are presented at the end of this report for the three lines that were fully sampled (NH, FM, and CR), and for the partial section off Eureka. Vertical sections of alongshore velocity measured by ADCP are presented for each of these lines and also for a line off the Rogue River. All sections show evidence of strong upwelling at the coast, consistent with the late-season upwelling-favorable winds that prevailed during much of September. Also included at the end of this report is a plot of the trajectories of the 15-m drogued drifters deployed during this cruise. Four of the six drifters show evidence of the large anticyclonic eddy which can be clearly seen in the ADCP and temperature sections for the NH-line. Its center appears to lie near 44.5 N, 125.2 W; the 7 and 8C isotherms and the 26.6 isopycnal were significantly depressed at this longitude.

Table 1. Intended CTD station positions, and intended sampling at each station (showing Station name, distance (km) to shore, longitude, depth (m), and additional sampling (C: Bio/Chem bottle sampling, D: Drifter deployment, N: net tows)

Newport Hydro Line along 44-39.1°N
