Edward.D.Cokelet@noaa.gov

Port of Embarkation: Kodiak, Alaska
Port of Debarkation: Juneau, Alaska

Cruise Goals/Scientific Purpose

The purpose of this July–August 2003 OCC/GLOBEC (Ocean Carrying Capacity/Global Ocean Ecosystem Dynamics) cruise was to investigate the relationships between physical and biological oceanographic processes that affect the distribution of juvenile salmon in the coastal Gulf of Alaska. Measurements focused on oceanographic properties and the distribution of zooplankton and salmon (*Oncorhynchus* spp) along 10 transects covering the continental shelf and slope. The cruise sampling began at Kodiak Island, Alaska, along the Cape Chiniak transect and ended near Yakutat, Alaska, on the Ocean Cape transect (Fig.1). The primary participating laboratories were NOAA’s Pacific Marine Environmental Laboratory (PMEL) and the Alaska Fisheries Science Center’s (AFSC) Auke Bay Laboratory (ABL).

Cruise Objectives

1. Determine the continuous distribution of surface temperature, salinity, fluorescence and dissolved nitrate along the cruise track (Fig. 1).
2. Measure vertical profiles of ocean current velocity continuously along the cruise track.
3. Measure vertical profiles of temperature, salinity and fluorescence at discrete sampling stations along 10 transects.
4. Determine the distribution of zooplankton within the study area.
5. Determine the distribution of juvenile salmon within the study area.

Cruise Participants

Edward D. Cokelet	Oceanographer/PMEL
Jamal Moss	Biologist/ AFSC/ABL
Christine Kondzela	Geneticist/ AFSC/ABL
Angela Middleton	Biologist/ AFSC/ABL
William Floering	Oceanographer/ PMEL

Daniel Badger
Rhys Smoker
Kimberly Meline

Oceanographer/ UW/JISAO
Student/ University of Washington
Student/ Humboldt State University
Teacher at Sea

Sampling Activities

The OCC/GLOBEC survey in the coastal waters of the Gulf of Alaska was conducted 18 July-9 August 2003 aboard the NOAA research vessel *Miller Freeman* (66 m). Transects sampled during the survey were perpendicular to shore and extended from nearshore across the continental shelf and slope to oceanic waters beyond the 2000-m depth contour (Fig. 1). Sampling stations along each transect were generally spaced 18.5 km (10 nm) apart and numbered sequentially seaward. Each transect included a nearshore station less than 4 km from shore.

At each station sampling usually began with a CTD (conductivity-temperature-depth) cast to near bottom or 1500 m, whichever was shallower (Fig. 1, Table 1). Depth profiles of temperature, salinity, fluorescence and photosynthetically-available-radiation (PAR) were collected using a Sea-Bird SBE 911+ CTD profiler, a WETLabs WETStar fluorometer and a Biospherical PAR sensor¹. On each cast, Niskin bottles collected discrete water samples for salinity, fluorescence and nutrient calibration against the CTD and flow-through systems.

Plankton samples were collected using a 1-m² Tucker trawl fitted with a 505- μ m mesh net towed near surface at approximately 1 knot for 5 minutes (Table 1). On some occasions tows at 20-m depth were conducted to determine how potential salmon prey distributions changed with depth. The volume of water filtered by the net was measured using a flow meter, and the plankton samples were preserved in 5% formalin.

Fish samples were collected with a 198-m-long mid-water rope trawl with hexagonal mesh wings and body, and a 1.2-cm mesh liner in the codend (Fig. 2, Table 1). The rope trawl was towed at 3.5 to 5 kt, at or near surface, and had a typical spread of 40-m horizontally and 14-m vertically. All tows lasted 30 minutes and covered 1.5 to 2.8 nautical miles. All fish sampling was done during daylight hours. Sometimes this meant that salmon trawls preceded CTD casts. For reference, sunrise occurred at 06:04 ADT and sunset at 22:27 ADT on 1 August 2003 at 58° N. Alaska Daylight Time (ADT) is 8 hours earlier than Greenwich Mean Time (GMT).

Salmon and other fishes were sorted by species and counted. Standard biological measurements including fork length, body weight and sex. Scale samples from a preferred area (to document age and growth) were taken from subsamples of all salmon species. Subsamples of juvenile pink (*Oncorhynchus gorbuscha*), chum (*O. keta*), and sockeye (*O. nerka*) salmon were frozen whole for laboratory analyses of food habits, otolith hatchery thermal marks (pink and chum salmon), and genetic analysis (chum salmon). Tissues and otoliths were also saved from immature and maturing chum salmon to determine stock distribution and migration of these salmon. All other fish species

¹ Reference to trade names does not imply endorsement by NOAA.

were counted; juvenile rockfish (*Sebastes* spp.) and sablefish (*Anoplopoma fimbria*) were frozen whole for laboratory analyses.

Several parameters were measured from the ship's flow-through system pumping sea water from the sea chest at keel depth (~ 5m). A thermosalinograph, fluorometer and nutrient sensor provided continuous measurements of near-surface temperature, salinity, fluorescence and dissolved nitrate.

The current beneath the ship was measured continuously with a 150-kHz RDI acoustic Doppler current profiler (ADCP). A differential Global Positioning System (DGPS) receiver and a TSS POS/MV GPS-based attitude-determination-unit provided associated position and heading measurements.

Satellite-tracked drifting buoys drogued at 40-m were deployed at designated trawl stations to measure the strength and direction of the current along the continental shelf.

Daily Cruise Summary

18 July – 29 July ADT

The ship departed Kodiak, Alaska, on July 18 and performed gear trials near Cape Chiniak (Figs. 1 and 2). The cruise proceeded to the nearshore station along the Cape Chiniak transect on the evening of July 18, and work on this transect began on the morning of July 19. Standard work at each station included vertical CTD cast, a surface tow for zooplankton using a Tucker trawl, and a surface tow for salmon and other marine fishes using the rope trawl. The cruise continued sampling along the Cape Chiniak (July 19-20), Cape Kaguyak (July 21-22), Cape Kekurnoi (July 22-23), Cape Nukshak (July 23-24), Gore Point (July 24-26), and Seward Lines (July 27-29). A PMEL current meter mooring, 03-SSP-3A, was recovered on the Cape Kekurnoi transect on 23 July. Satellite-tracked drifters were deployed on the Seward Line at stations GAK2, GAK4 and GAK6.

30 July – 31 July ADT

The ship joined the R/V *Alpha Helix* in Blying Sound near the Seward Line to observe how juvenile salmon are distributed relative to surface salinity. We conducted a series of CTD casts, Tucker hauls and salmon trawls within and seaward of the brackish sea-surface signature of the Alaska Coastal Current (ACC). *Alpha Helix* followed us conducting vertically stratified MOCNESS trawls for zooplankton and CTDs at the same sites. Our strategy was to use the ship's thermosalinograph to locate sampling sites. Often a front visible at the sea surface separated brackish water at 27 psu, assumed to be the ACC, from high-salinity water to seaward at 31 psu. On 30 July we sampled four sites - two in the ACC and two in the salty water seaward of it. They were as follows (Fig. 3): GAK1i at 27 psu surface salinity - presumably in the ACC, GAK3 and BS3 (Blying Sound 3) at 31 psu seaward of the ACC, and BS2 at 27 psu. On 31 July we sampled four more sites - one each on either side of the salinity front and two within it (Fig. 3). They were CF2 (Cape Fairfield 2) at 27 psu, CF12 at 31 psu, CF8 within the front at 28.2 psu and AC1 (Aialik Cape 1) within the front at 29 psu. (Note that *Alpha Helix* used the station names "BS1" and "GAK2" for our stations BS2 and AC1, respectively.)

The near-surface salinity from the thermosalinograph is plotted along the cruise track along with the CPUE for juvenile pink, chum, coho and sockeye salmon in Figures 3-6. The juvenile chinook salmon catch is not plotted; only 3 were caught in this region (Table 2). The trackline salinity shows saltier water (>31 psu) generally to seaward in red-to-orange colors. Fresher water (<27 psu) in the ACC is shown as green, and the front between (~29 psu) is in shades of yellow. At the start of this series it was postulated that juvenile salmon would be caught in the less-salty ACC water and not in the saltier water to seaward. The results plotted in Figures 3-6 refute that hypothesis. Juvenile pink and chum were found in both the fresher and saltier water, but not always within the transition zone between. Coho and sockeye juveniles were located in the saltier water.

1 August – 9 August ADT

Miller Freeman broke off from *Alpha Helix* late on 31 July and resumed standard sampling along the Cape Cleare (1-2 Aug), Cape St. Elias (August 3), Cape Yakataga (August 4-5) and Ocean Cape (August 6-7) lines. A satellite-tracked drifter was deployed at station CSE2 along the Cape St. Elias transect. After standard sampling was completed on 7 August, the ship transited to Glacier Bay, Alaska. There we ran thermosalinograph and ADCP transects along the bay's West and East Arms on 8 August. The cruise concluded in Juneau, Alaska, at 09:00 9 August 2003.

Summary of Salmon Sampling Results

During the survey, 86 trawl stations were sampled (Fig. 2), and a total of 15,442 salmon were captured (Table 2). The largest component of the catch was juvenile salmon including pink (52.7% of total catch), chum (16.5%), sockeye (8.9%), coho (*O. kisutch*; 8.8%), and chinook (*O. tshawytscha*; <0.1%). Immature salmon in our catch included chum (4.0%), sockeye (1.2%), and chinook (0.3%). Maturing salmon in our catch included pink (5.7%), chum (1.1%), sockeye (1.2%), coho (0.4%) and chinook (<0.1%) salmon. Other species captured during the survey are listed in Table 3.

Salmon distribution as detected by the survey varied by life history stage (Table 2). Juvenile salmon were mainly distributed along the shelf with the highest catch per unit effort (CPUE = number of salmon caught during a 30-minute trawl) of juvenile pink (Fig. 7) and chum salmon (Fig. 8) occurring west of Prince William Sound (PWS). The highest CPUE of juvenile coho salmon occurred east of PWS (Fig. 9), and the highest CPUE for juvenile sockeye occurred West of PWS and within Shelikof Strait (Fig. 10). The highest CPUE for juvenile chinook salmon occurred along the Cape Cleare transect (Fig. 11). Immature chum salmon were found along all transects sampled with the largest CPUE generally occurring at offshore locations beyond the 200-m contour. Immature sockeye salmon were most commonly distributed along transects on the Gulf of Alaska side of Kodiak Island. Immature chinook salmon were mainly distributed west of PWS, however, the station with the highest CPUE was located along the Cape Cleare transect. Mature pink and chum salmon were found along all transects sampled.

Results from the oceanographic and fisheries measurements await calibrations, laboratory analyses and data processing.

Acknowledgments

We thank Dr. Gary Stauffer, AFSC, for help in obtaining ship time aboard NOAA Ship *Miller Freeman*. We also thank CMDR Tim Clancy and the officers and crew for their assistance with many aspects of our field survey. It was a pleasure sailing on *Miller Freeman* with her good accommodations, meals, laboratory space, computer facilities and deck-crew support.

List of Tables

Salinity & Juv. Sockeye Salmon CPUE, *Miller Freeman MF-03-10*, 29 Jul-1 Aug 2003

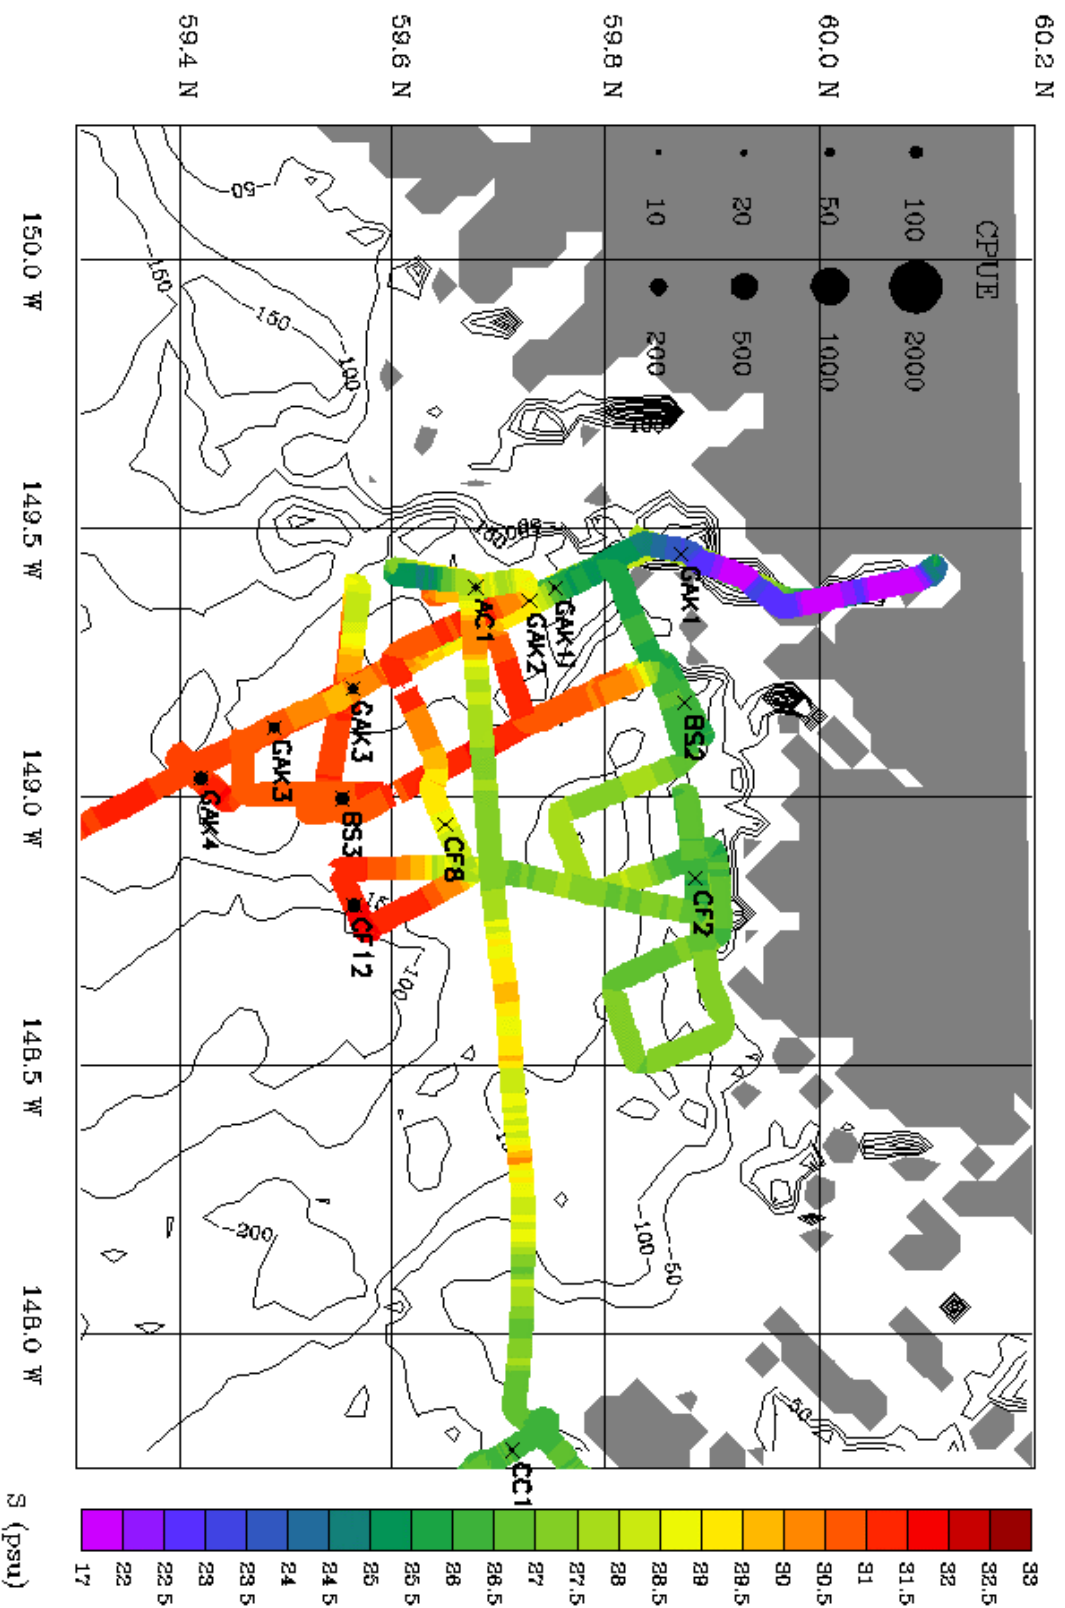

Figure 6. Near-surface salinity and juvenile sockeye salmon CPUE on the Seward Line and in Blyling Sound.

Juvenile Pink Salmon CPUE, OCC/GLOBEC Cruise MF-03-10, 18 July-9 Aug 2003
 Depth contours at 0, 100, 200, 500, 1000, 2000 m

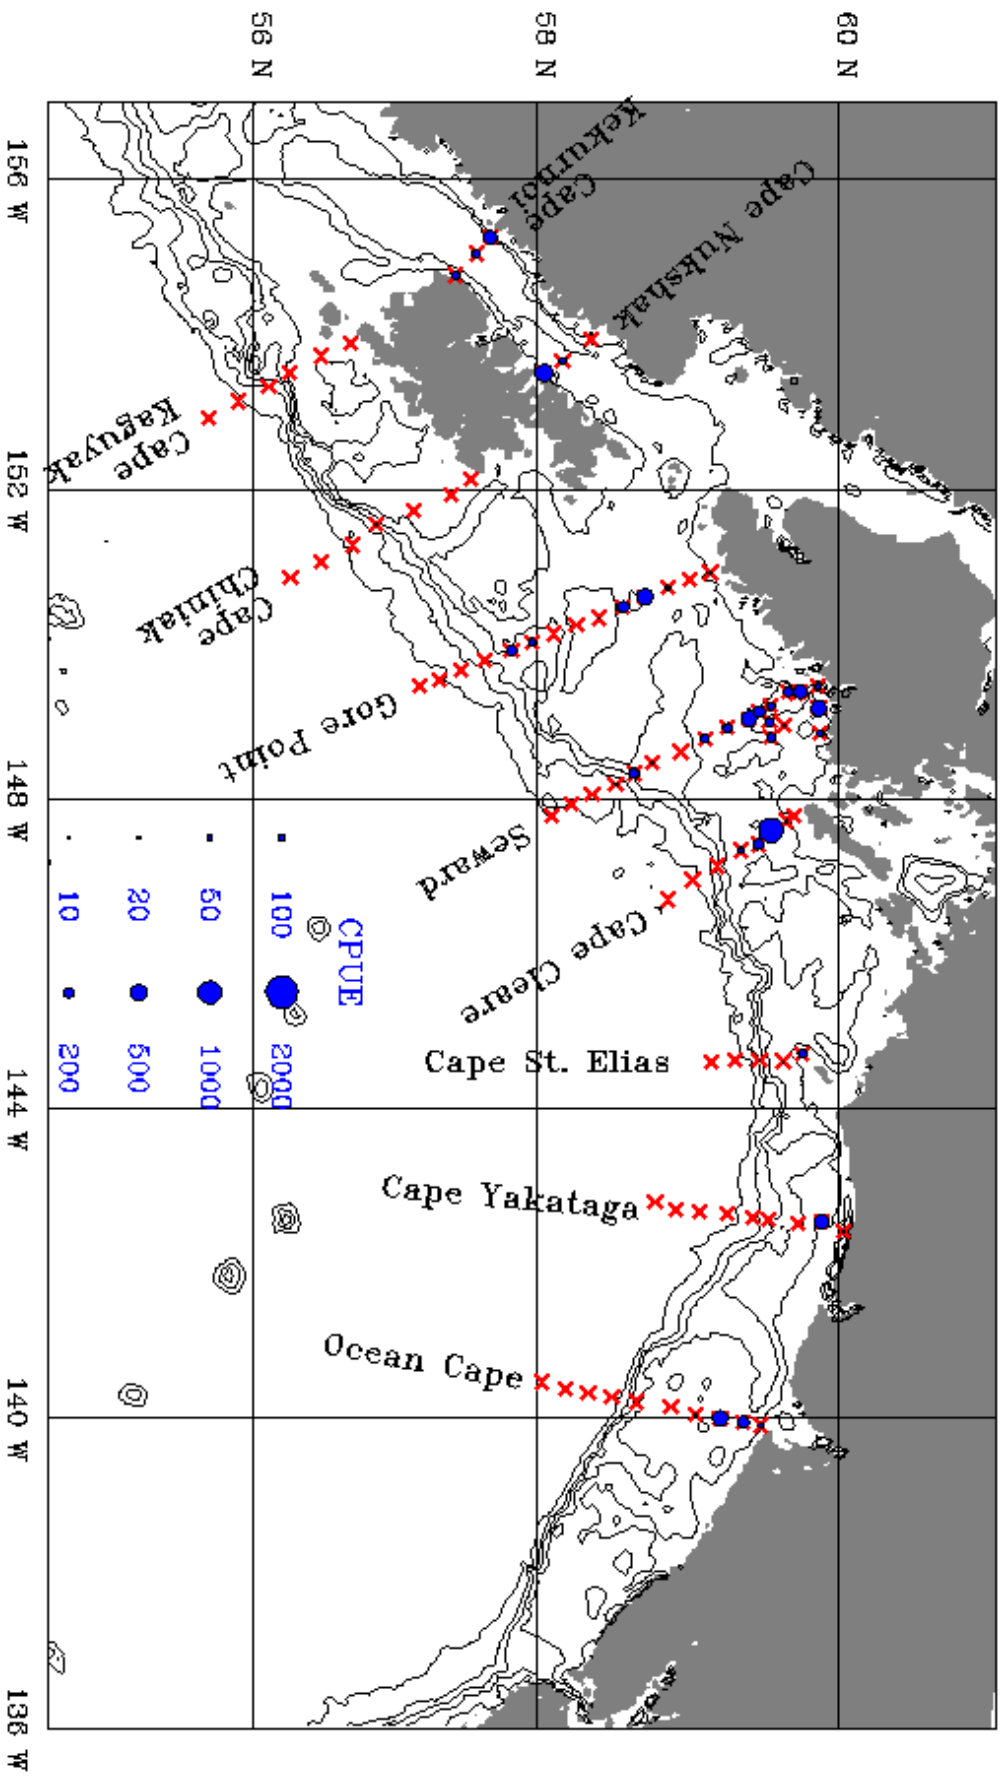

Figure 7. Juvenile pink salmon CPUE from Miller Freeman cruise MF-03-10.

Juvenile Chum Salmon CPUE, OCC/GLOBEC Cruise MF-03-10, 18 July-9 Aug 2003
 Depth contours at 0, 100, 200, 500, 1000, 2000 m

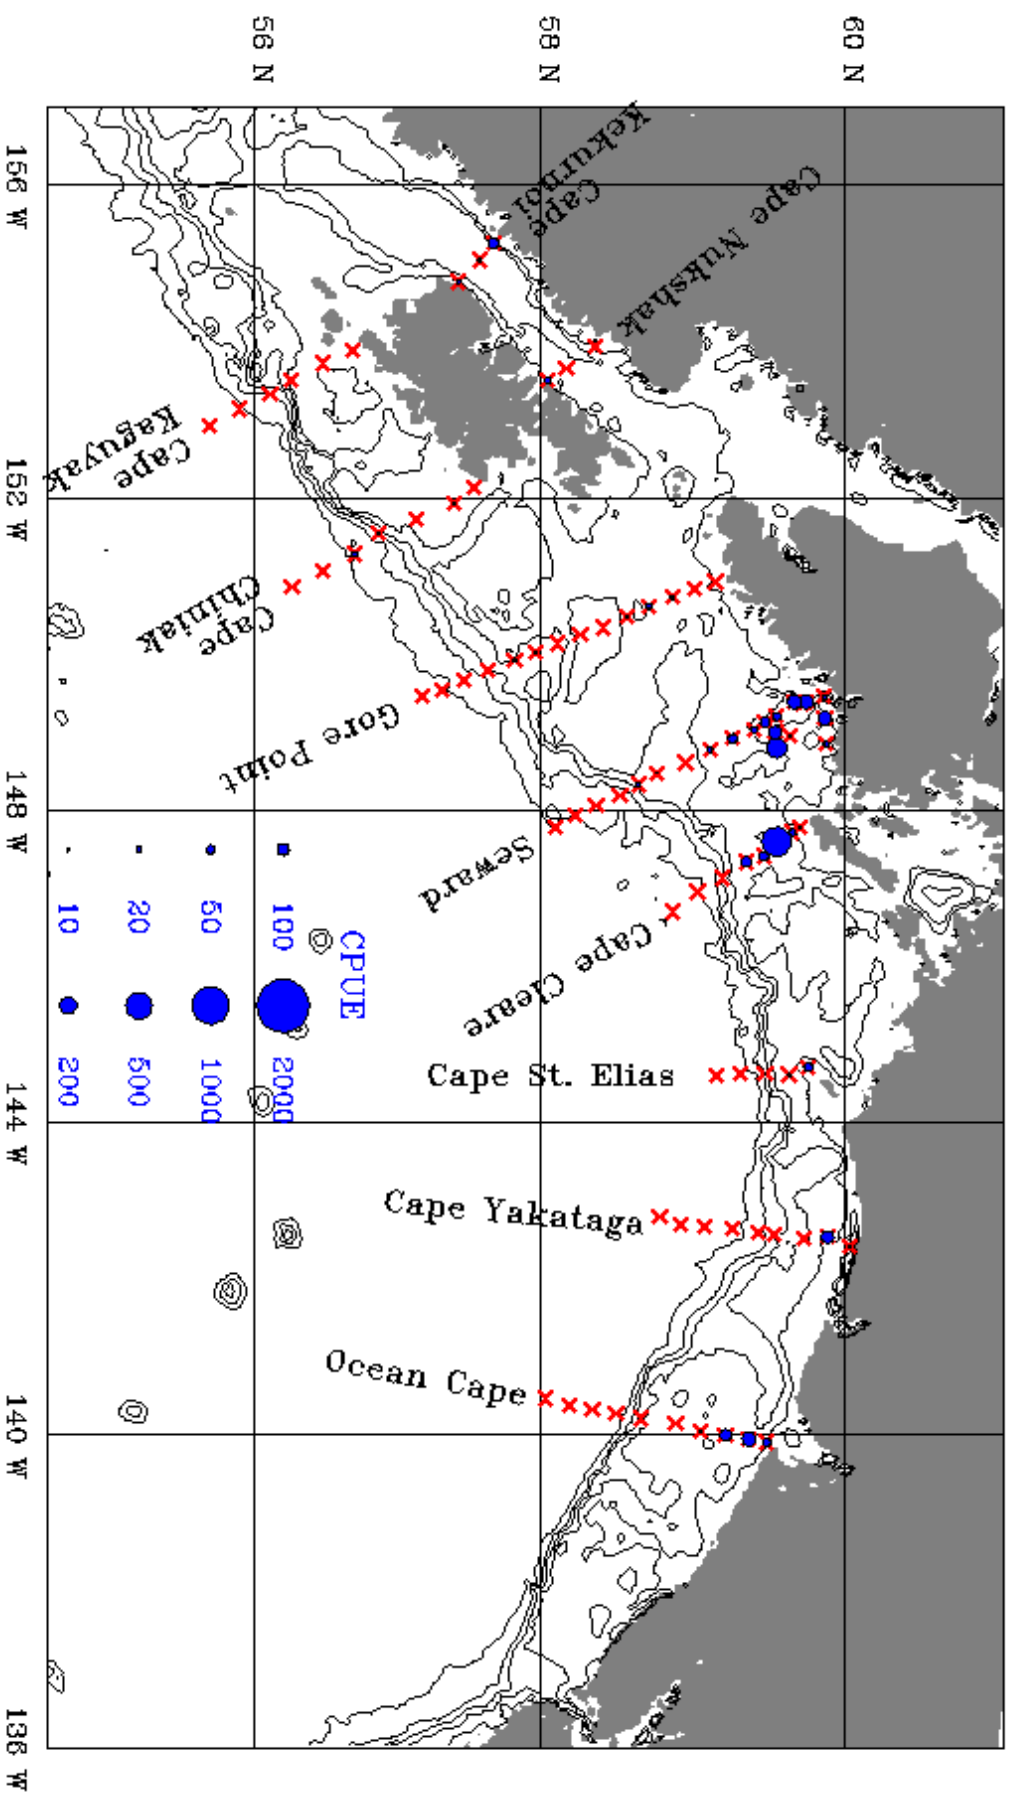

Figure 8. Juvenile chum salmon CPUE from Miller Freeman cruise MF-03-10.

Juvenile Coho Salmon CPUE, OCC/GLOBEC Cruise MF-03-10, 18 July-9 Aug 2003
 Depth contours at 0, 100, 200, 500, 1000, 2000 m

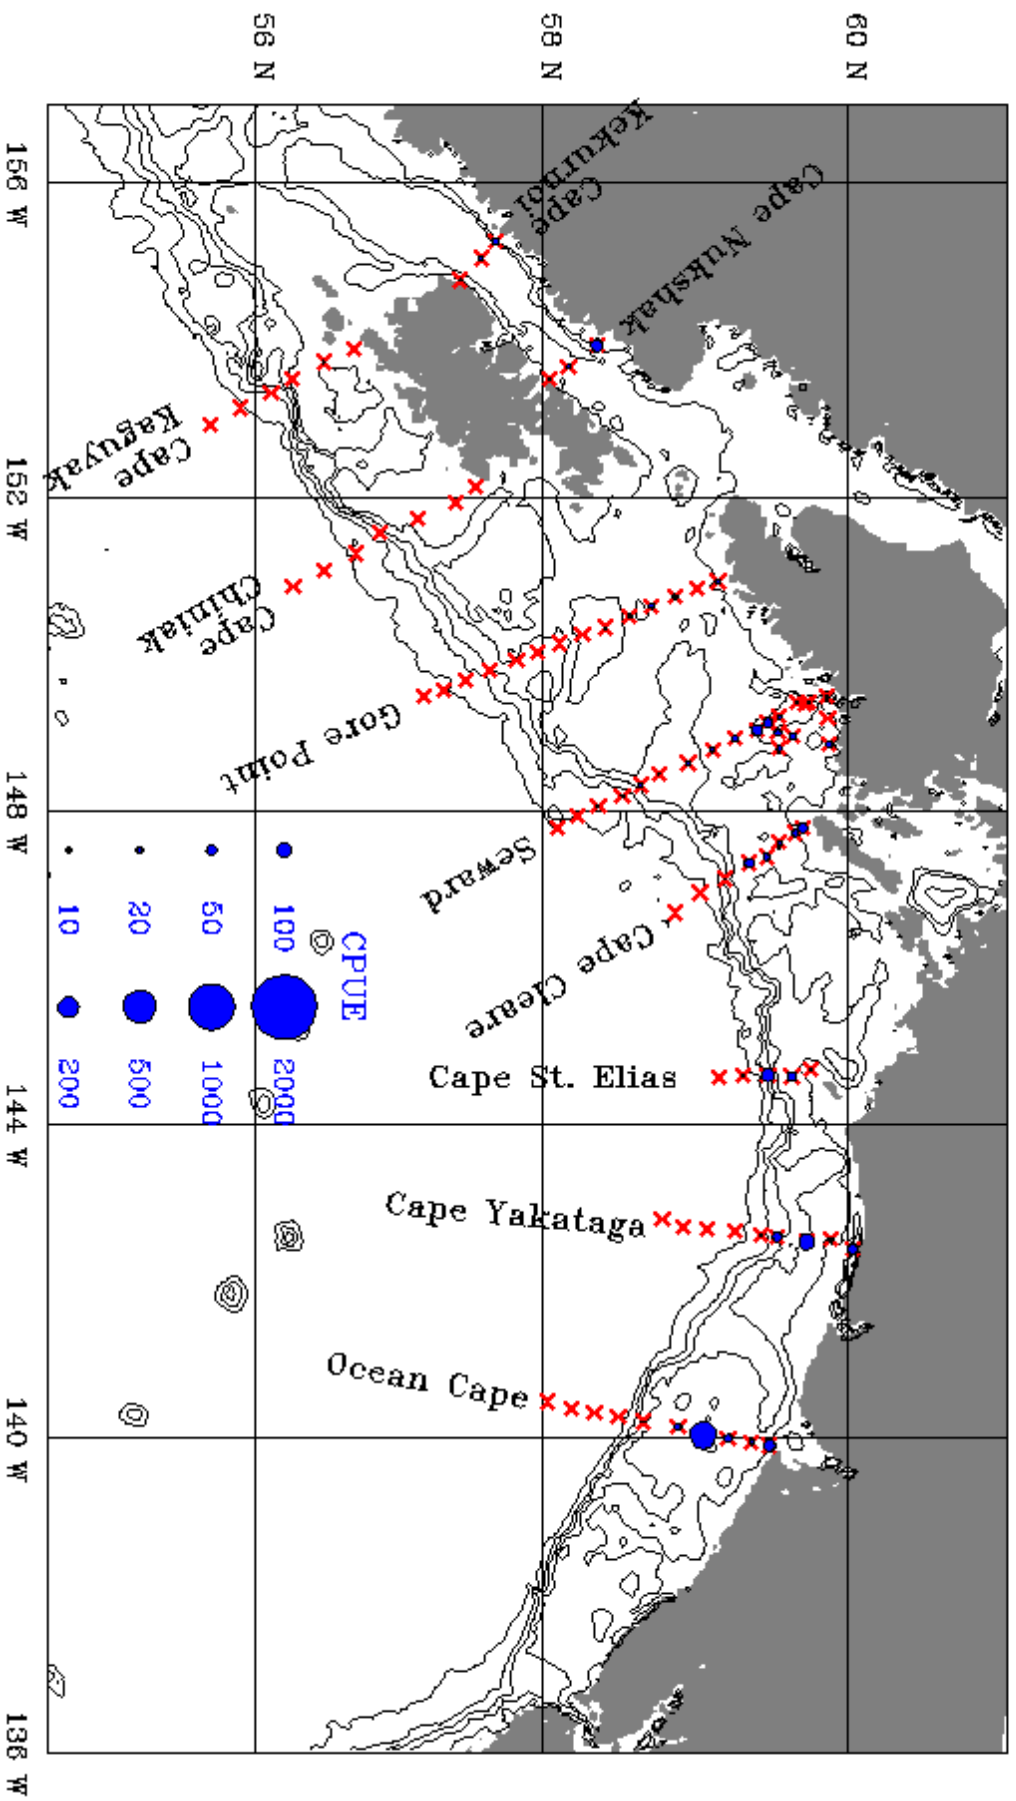

Figure 9. Juvenile coho salmon CPUE from Miller Freeman cruise MF-03-10.

Juvenile Sockeye Salmon CPUE, OCC/GLOBEC Cruise MF-03-10, 18 July-9 Aug 2003
 Depth contours at 0, 100, 200, 500, 1000, 2000 m

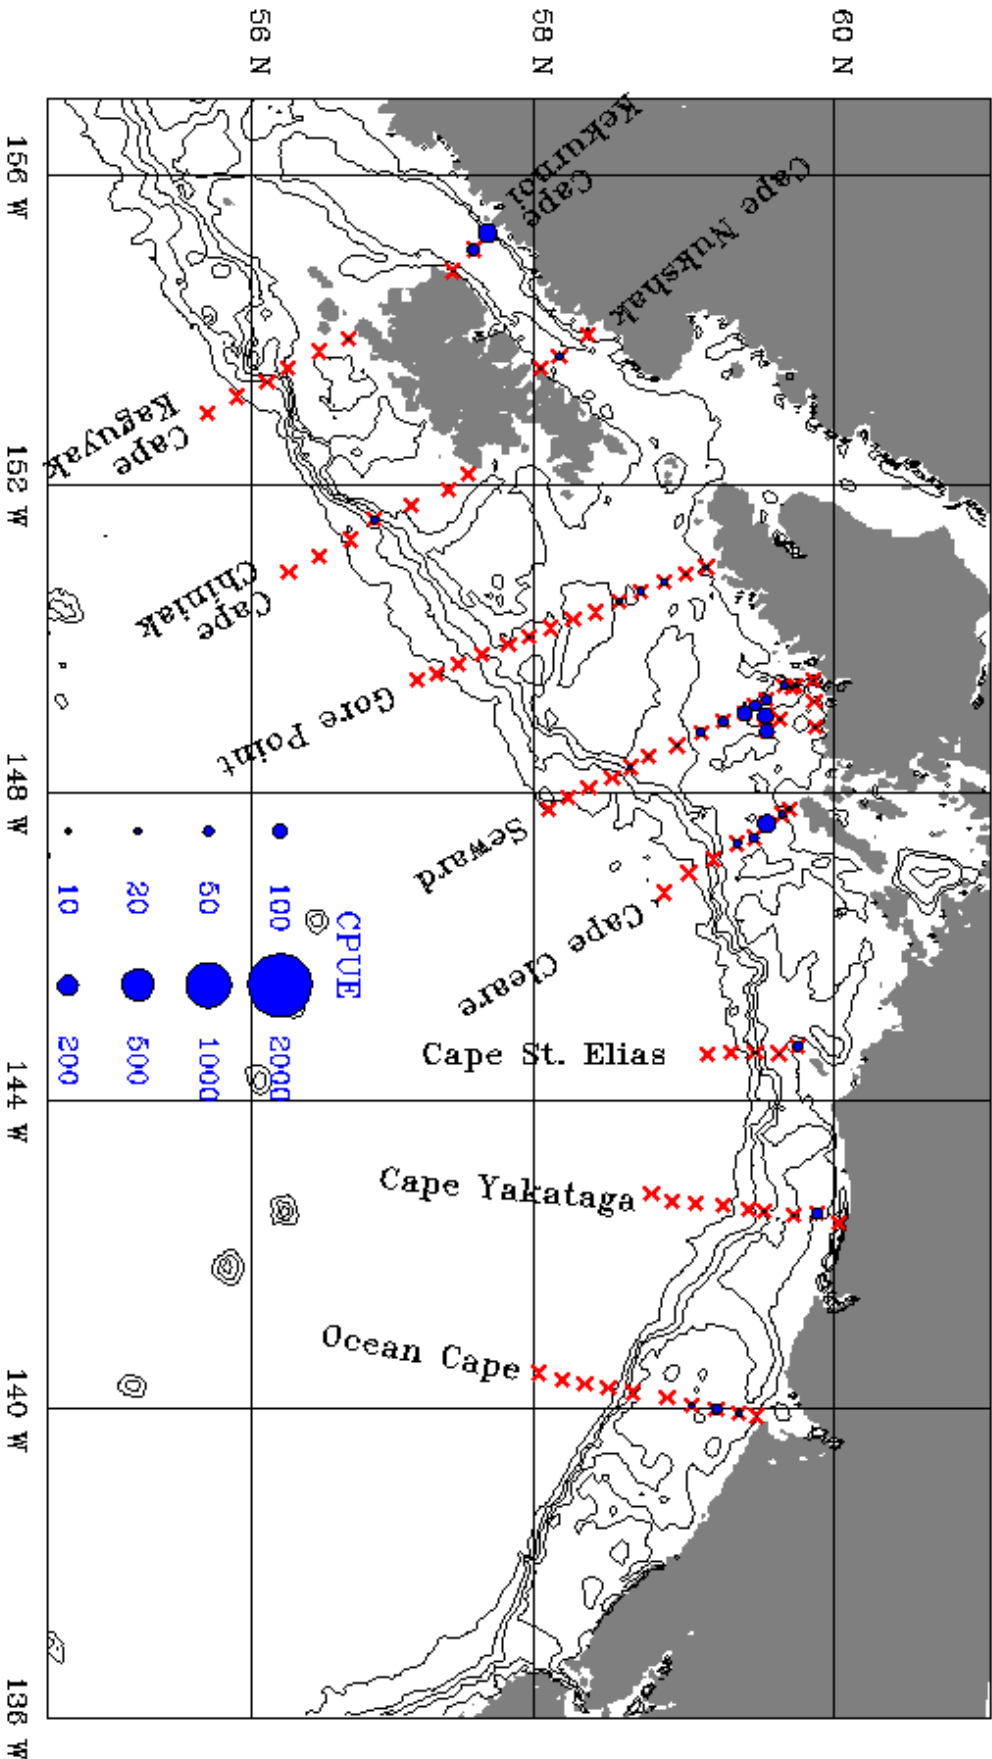

Figure 10. Juvenile sockeye salmon CPUE from Miller-Freeman cruise MF-03-10.

Juvenile Chinook Salmon CPUE, OCC/GLOBEC Cruise MF-03-10, 18 July-9 Aug 2003
 Depth contours at 0, 100, 200, 500, 1000, 2000 m

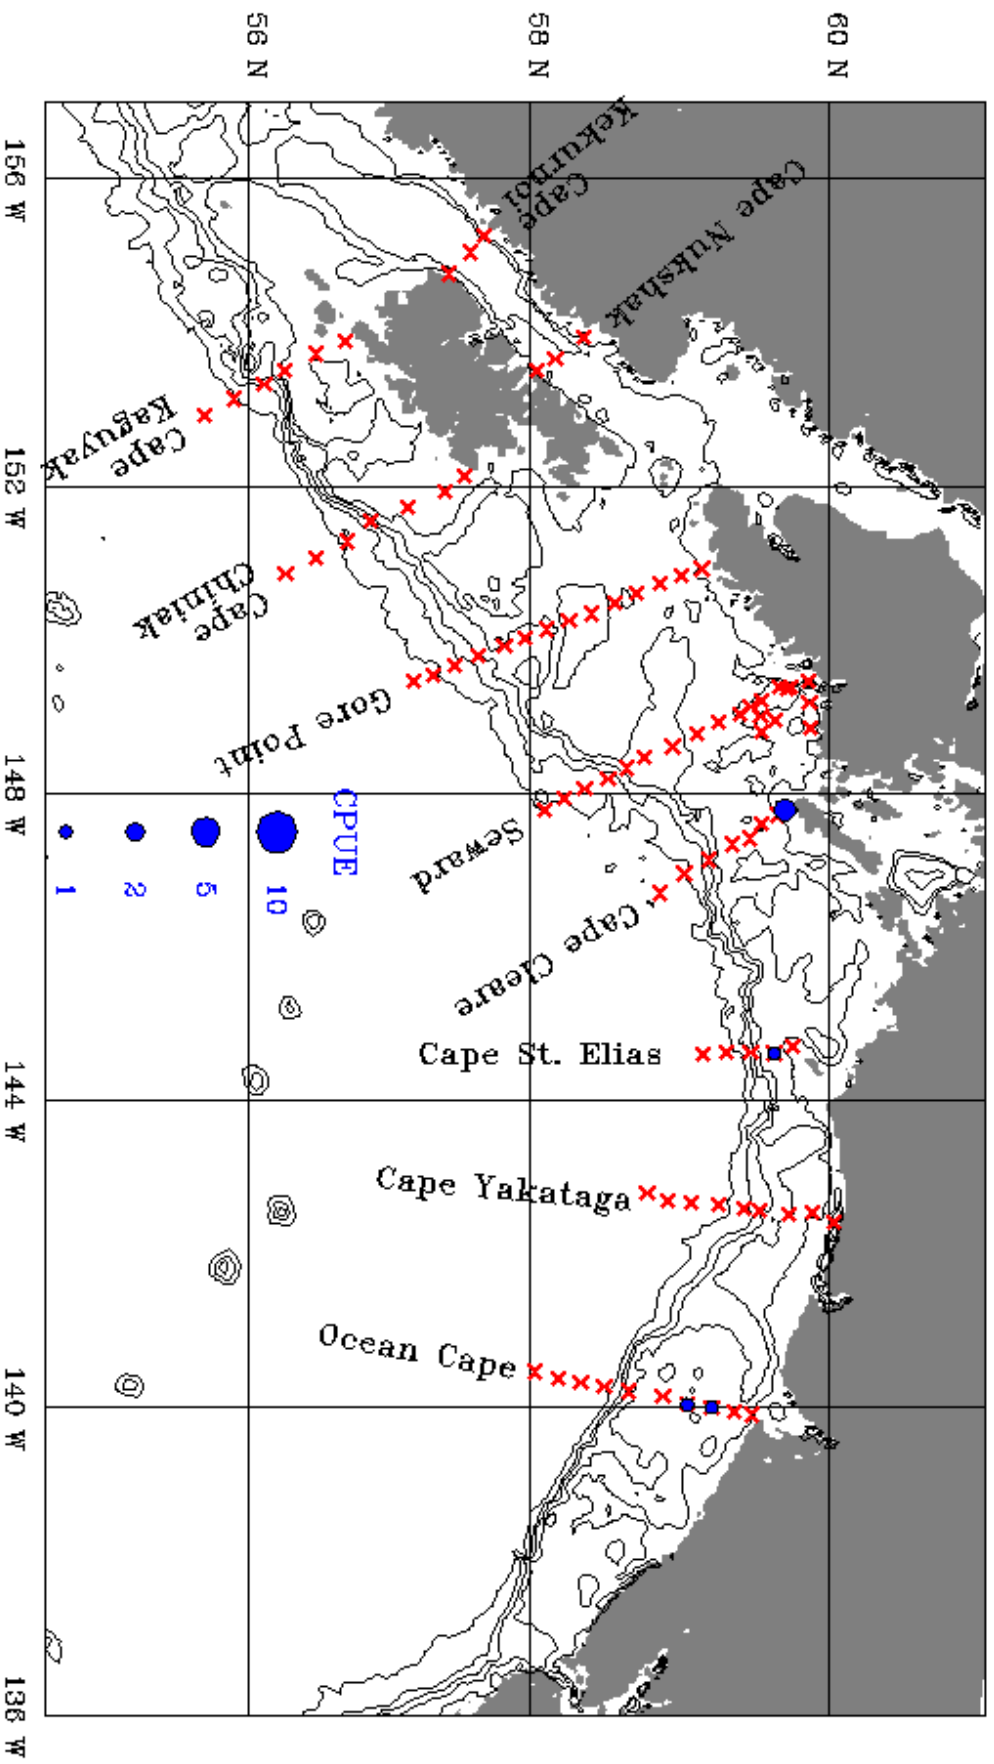

Figure 11. Juvenile chinook salmon CPUE from Miller Freeman cruise MF-03-10.
